(57) The eave assembly 10 has a fascia 13 which includes soffit panel support devices e.g. 18,34. Inner longitudinal soffit support devices 15,16 extend along a wall 12 and transverse support members 40 extend therefrom to the fascia. Soffit panels 11 are disposed in end to end relationship along the eave with opposite sides 14,17 supported by the support devices 15,16,18 etc. Each transverse support member 40 has a lower flange 42 with a beam-like web extending upwardly therefrom which has intermediate flanges 43 extending therefrom to form recesses of channel shape for the soffit panel edges. The intermediate flanges 43 have an inner portion adjacent the web which extends beyond the extent of the lower flange, and are spaced from the lower flange by a distance greater than the extent of the lower flange from the web. Outer portions of the intermediate flanges extend along the inner portions and form opposed retaining devices 45 which engage the transverse edges of the soffit panels. The outer portions of the intermediate flanges can be resilient.
